

## Working Definitions for EBPs

Evidence-based Practice	Definition
Antecedent-based intervention (ABI)	Arrangement of events or circumstances that precede the occurrence of an interfering behavior and designed to lead to the reduction of the behavior.
Behavioral momentum intervention (BMI)	Organization of behavior expectations in a sequence in which low probability/preference behaviors are embedded in a series of high probability/preference behaviors in order to increase the occurrence of the low probability/preference behaviors.
Cognitive behavioral intervention (CBI)	Instruction on management or control of through processes that lead to changes in overt behavior.
Differential reinforcement: of Alternative, Incompatible, or Other Behavior (DRA/I/O)	Provision of positive/desirable consequences for behaviors or their absence that reduce the occurrence of an undesirable behavior. Reinforcement provided: a) when the learner is engaging in a specific desired behavior other than the inappropriate behavior (DRA), b) when the learner is engaging in a behavior that is physically impossible to do while exhibiting the inappropriate behavior (DRI)

	or c) when the learner is not engaging in the interfering behavior (DRO).
Discrete trial teaching (DTT)	Instructional process usually involving one teacher/service provider and one student/client and designed to teach appropriate behavior or skills. Instruction usually involves massed trials; each trial consists of the teacher's instruction/presentation, the child's response, a carefully planned consequence, and a pause prior to presenting the next instruction.
Exercise (ECE)	Increase in physical exertion as a means of reducing problem behaviors or increasing appropriate behavior.
Extinction (EXT)	Withdrawal or removal of reinforcers of interfering behavior in order to reduce the occurrence of that behavior. Although sometime used as a single intervention practice, extinction often occurs in combination with functional behavioral assessment, functional communication training, and differential reinforcement.
Functional behavior assessment (FBA)	Systematic collection of information about an interfering behavior designed to identify functional contingencies that support the behavior. FBA consists of describing the interfering or problem behavior, identifying

	<p>antecedent or consequent events that control the behavior, developing a hypothesis of the function of the behavior, and/or testing the hypothesis.</p>
<p>Functional communication training (FCT)</p>	<p>Replacement of interfering behavior that has a communication function with more appropriate communication that accomplishes the same function. FCT usually includes FBA, DR-A, and/or EX.</p>
<p>Modeling (MD)</p>	<p>Demonstration of a desired target behavior that results in imitation of the behavior by the learner and that leads to the acquisition of the imitated behavior. This EPB is often combined with other strategies such as prompting and reinforcement.</p>
<p>Naturalistic intervention (NI)</p>	<p>Intervention strategies that occur within the typical setting/activities/routines in which the learner participates. Teachers/service providers establish the learner's interest in a learning event through arrangement of the setting/activity/routine, provide necessary support for the learner to engage in the targeted behavior, elaborate on the behavior when it occurs, and/or arrange natural consequences for the targeted behavior or skills.</p>
<p>Parent-implemented intervention (PII)</p>	<p>Parents provide individualized intervention to their child to improve/increase a wide</p>

	<p>variety of skills and/or to reduce interfering behaviors. Parents learn to deliver interventions in their home and/or community through a structured parent training program.</p>
<p>Peer-mediated instruction and intervention (PMII)</p>	<p>Typically developing peers interact with and/or help children and youth with ASD acquire new behavior, communication, and social skills by increasing social and learning opportunities within natural environments. Teachers/service providers systematically teach to peers strategies for engaging children and youth with ASD in positive and extended social interactions in both teacher-directed and learner-initiated activities.</p>
<p>Picture Exchange Communication System (PECS)</p>	<p>Learners are initially taught to give a picture of a desired item to a communicative with partner in an exchange for the desired item. PECS consists of six phases which are: (1) Teaching the physically assisted exchange, (2) Expanding spontaneity, (3) Simultaneous discrimination of pictures, (4) Building sentence structure, (5) Responding to, “What do you want?” and (6) Commenting in response to a question.</p>

Pivotal response training (PRT)	Four pivotal learning variables (i.e., motivation, responding to multiple cues, self-management, and self-initiations) guide intervention practices that are implemented in setting the builds on learner interests and initiative.
Prompting (PP)	Verbal, gestural, or physical assistance given to learners to assist them in acquiring or engaging in a targeted behavior or skill. Prompts are generally given by an adult or peer before or as a learner attempts to use a skill.
Reinforcement (R+)	An event, activity, or other circumstance occurring after a learner engages in a desired behavior that leads to the increased occurrence of the behavior in the future.
Response interruption/redirection (RIR)	Introduction of a prompt, comment, or other distractors when an interfering behavior is occurring that is designed to divert the learner's attention away from the interfering behavior and results in its reduction.
Scripting (SC)	A verbal and/or written description about a specific skill or situation that serves as a model for the learner. Scripts are usually practiced repeatedly before the skill is used in the actual situation.
Self-management	Instruction focusing on learners'

(SM)	discriminating between appropriate and inappropriate behaviors, accurately monitoring and recording their own behaviors, and rewarding themselves for behaving appropriately.
Social narratives (SN)	Narratives that describe social situations in some detail by highlighting relevant cues and offering examples of appropriate responding. Social narratives are individualized according to learner needs and typically are quite short, perhaps including pictures or other visual aids.
Social skills training (SST)	Group or individual instruction designed to teach learners with autism spectrum disorders (ASD) ways to appropriately interact with peers, adults, and other individuals. Most social skill meetings include instruction on basic concepts, role-playing or practice, and feedback to help learners with ASD acquire and practice communication, play, or social skills to promote positive interactions with peers.
Structured Play Groups (SPG)	Small groups activities characterized by their occurrences in a defined area and with a defined activity, specific selection of typically developing peers to be in the group, clear delineation of theme and roles by adult leading the, and/or prompting or

	<p>scaffolding as needed to support the students’ performance related to the goals of the activity.</p>
<p>Task analysis (TA)</p>	<p>A process in which an activity or behavior is divided into small, manageable steps in order to assess and teach the skill. Other practices, such as reinforcement, video modeling, or time delay, are often used to facilitate acquisition of the smaller steps.</p>
<p>Technology-aided intervention and instruction (TAII)</p>	<p>Instruction or interventions in which technology is the central feature supporting the acquisition of a goal for the learner. Technology is defined as “any electronic item/ equipment/application/or virtual network that is used intentionally to increase/maintain, and/or improve daily living, work/productivity, and recreation/leisure capabilities of adolescents with autism spectrum disorders” (CSESA Technology Group, 2013).</p>
<p>Time delay (TD)</p>	<p>In a setting or activity in which a learner is should engage in a behavior or skill, a brief delay occurs between the opportunity to use the skill and any additional instructions or prompts. The purpose of the time delay is to allow the learner to respond without having to receive a prompt and thus focuses on fading the use of prompts during</p>

	instructional activities.
Video modeling (VM)	A visual model of the targeted behavior or skill (typically in the behavior, communication, play or social domains), provided via video recording and display equipment to assist learning in engaging in a desired behavior or skill.
Visual supports (VS)	Any visual display that supports the learner engaging in a desired behavior or skills independent of prompts. Examples of visual supports include pictures, written words, objects within the environment, arrangement of the environment or visual boundaries, schedules, maps, labels, organization systems, and timelines.
