Legislation Impacting Audiology and the Provision of Audiological Services: A review of Legislation Across the United States

*University of Miami Mailman Center for Child Development, **University of South Dakota

Abstract
The purpose of this review was to investigate the legislation impacting the provision of audiologic services. A systematic review was conducted to collect state specific legislation regarding audiologic licensure requirements, requirements about the identification and management of children with hearing loss, and insurance coverage regulations. Data was analyzed for similarities and differences between state regulations and legislature. Results found that all states require audiologists to hold licensure; however many differences exist between requirements of acquiring and maintaining the license. Additionally, some states regulate the identification and management of children with hearing loss while others do not. States differ in their regulation of services provided to children with hearing loss, who can provide services, and what is covered by insurance. In conclusion, it is critical for audiologists to understand requirements of their state regarding the provision of audiologic services and how this impacts potential services provided to children with hearing loss.

Introduction
The field of audiology is relatively young in comparison to other medical professions and has experienced tremendous changes since its inception. It is not clear, however, that state legislation has kept up-to-date with, and is reflective of, the current state of audiologic service provision. Two specific areas of audiology that have expanded with the profession and are directly impacted by state legislation are (1) Early Hearing Detection and Intervention (EHDI) programs and (2) insurance reimbursement for hearing assistive technology. Although every state and territory in the U.S. has developed some form of an Early Hearing Detection and Intervention program (National Center for Hearing Assessment & Management [NCHAM], 2012), not all states within the U.S. have enacted statues or other legislation related to EHDI and the consistency of these programs across states is unclear.

A second area impacted by legislation is insurance coverage of hearing assistive technology (HAT). Many health insurance plans do not cover audiological services and hearing assistive technology (HAT). Medicaid, however does cover audiological services and HAT (Centers for Medicare & Medicaid Services, 2013). For children who do not qualify for Medicaid, insurance coverage of audiological services and HAT may be more variable.

Research Questions
1) What similarities and differences in state legislation exist in regards to the identification of and audiological services provided to children with hearing loss?

Methods
From July 2012 to July 2013, copies of state statutes or legislation related to EHDI programs, insurance coverage of HAT, and licensure of audiologists was obtained from all 50 states within the United States, including the District of Columbia. This information was obtained from (1) the state website, (2) the state EHDI coordinators, or (3) the state Department of Health and Human Services, (4) the state licensure board for each state. Full text documents were reviewed.

Results/Discussion
The number of states with licensure legislation based upon licensure requirements is shown in Figure 1. The number of states with legislation referencing guidelines set forth by the Joint Committee on Infant Hearing (JCIH, 2000, 2007) for state EHDI programs is plotted in Figure 2. Six states do not have legislation related to an EHDI program. One (1) state did not reference the goal of screening by one month of age or diagnosis by three months of age but did reference the goal of entering early intervention by six months of age. Nineteen (19) of the states with EHDI legislation do not reference any of the timelines recommended by JCIH. Twenty (20) states with EHDI legislation reference a need for appropriate intervention services. Legislation in only four (4) states indicated that the child should be monitored for hearing loss in their medical home. Only one (1) state referenced all of the guidelines suggested by JCIH. State legislation was also reviewed for discussion of reporting and consenting procedures, equipment use, and identification of audiologic diagnostic follow-up sites. The number of states with legislation addressing each of these areas is demonstrated in Figure 3. The final area of EHDI legislation reviewed was the identification of diagnostic pediatric audiology follow up sites. Thirty-five (35) states do not address this in legislation, eleven (11) specify the entity responsible for identifying the diagnostic audiology follow up site. Of these, five (5) specify an advisory board that identifies appropriate follow up sites.

Conclusions
1) With the exception of some areas and a small number of states, results from the current review suggest that legislation across the U.S. as it pertains to the provision of audiological services, largely does not accurately reflect the current degree requirements and scope of practice of the profession of audiology.
2) These discrepancies lead to several quandaries that need to be considered as a profession.
3) Discrepancies between states regarding audiology licensure, and issues with audiologists scope of practice, and legislation impacting EHDI all play a role in service provision. Furthermore, insurance coverage of hearing aids and HAT varies greatly across states.

References and Acknowledgements
I would like to extend a huge thanks to Dr. Jessica Messersmith, Ph.D. and Dr. Lindsey Jorgensen, Au.D., Ph.D., for inviting me to work on this research project during my time as a doctoral student at the University of South Dakota this past year. I would especially like to thank Dr. Jill Lockie, Au.D., for her for all her time and energy into this project. I would also like to thank my current clinic supervisor, Dr. Robert Filler, Ph.D. for his help in preparing the poster for the AUCD conference.
