

Be Careful with Fans During Pandemic

Good ventilation can help prevent spread of COVID-19 indoors. However, many

people assume this means they should turn on indoor fans. In fact, if a person infected with COVID-19 is in a room, regular home fans may help spread contaminated air particles. Opening windows to help fresh outside air to come in and stale indoor air to move out is a better option.

During the pandemic, when someone who is not a part of your household is in your house, or if someone in your household has COVID-19, it pays to take appropriate safety steps.

Take precautions to decrease risk of COVID-19 infection: Wear a mask. Practice social distancing. Wash hands regularly.
